Exploration Summary

- we have a dataframe consisting of 9827 rows and 9 columns
- our dataset looks a bit tidy with no NANs nor duplicated values
- Release_Data column needs to be casted into date time and to extract only the year value.
- Overview, Original_Language and Poster-Url wouldn't be so useful during analysis, so we'll drop them.
- there is noticable outliers in Popularity column.
- Vote_Average better be categorised for proper analysis.
- Genre column has comma saperated values and white spaces that needs to be handled and casted into category . Exploration Summary

- categorizing 'Vote_Average' column
- we would cut the 'Vote_Average' values and make 4 categories: 'popular' 'average' 'below_avg' 'not_popular' to describe it more using catigorize_col() function provided above.

In [32]:
```
def catigorize_col(df, col, labels):

    edges = [df[col].describe()['min'],
             df[col].describe()['25%'],
